

Durability and flexibility of Ultracork

combine to bring you Hastings' best gaskets.

Ultracork's flexibility allows it to retain its original shape and lay flat for easier installation.

Torque retention has been improved with a reduction in cork percentage and a change in granule size.

Ultracork's conformability, unlike rubber, insures a gasket does not extrude when loaded. Gaskets made with Ultracork recover to fill the designated gap when the load is removed.

Thread sealing keeps oil from escaping down the bolts, preventing bolt head leakage.

Smaller bolt holes help the gasket stay in place during installation.

Ultracork's sealability is a result of a unique combination of cork and rubber. Increased rubber content delivers impressive sealability; more than standard cork rubber.

Unlike any other pan gasket

Hastings' use of Ultracork brings controlled oil swell and the compressibility of cork to transmission filter gaskets. This creates a gasket that doesn't crack or tear, and one that can be folded without danger of future leaks. It's the perfect combination for performance.
